Research Interests

My research broadly spans the area of **computer architecture/systems, security, memory systems, and AI/ML**, with specific emphasis on the following areas:

- **Memory Security:** Developing techniques to secure memory systems, with a focus on RowHammer attacks and defenses. Investigating novel security attacks, performance degradation (Denial-of-Service) attacks, and timing-side channel vulnerabilities. Actively developing secure and low-overhead RowHammer mitigations, including per-row activation counting (PRAC)-based solutions, which are expected to become standard RowHammer mitigations for future DRAM products.
- **AI/ML Security:** Investigating emerging threats in AI/ML security, including LLM Jailbreaking attacks, and developing robust defenses to mitigate these risks.
- **Microarchitecture Designs:** Designing high-performance, energy-efficient microarchitectures by leveraging advanced compression techniques for prefetching, branch prediction, and cache replacement policies to optimize system efficiency.
